INTUITUS
Healthcare cockpit

Why a hospital cockpit?

Today's clinics and hospitals are managed just like companies, with targets for performance, patient quality optimisation, and structural costs. Department heads and managers need a decision cockpit to monitor activities and ensure that targets are properly achieved.

More than just a table containing a few statistics, it is a management tool where the department manager can personally, in a highly intuitive environment, track indicators, discover areas for optimisation, and monitor the quality of the service provided to the patient.

For imaging…. and everything else

INTUITUS aims first and foremost at optimising the quality of patient care, for example by reducing patient waiting times, and exam times according to modality, doctor, and technician, average interpretation times, the use of the medical devices by month, day, time slot, etc. INTUITUS helps to analyse the efficiency of the departments and personnel in order to improve processes and working methods. The Dose Archive and Communication System (DACS) covering all the departments is an additional feature of the system.

... and for the rest of the hospital

The INTUITUS product was designed as a single interface for all the interactive dashboards of all the departments in the hospital. Whilst guaranteeing the mandatory data confidentiality, INTUITUS gives managers a common vision of the measures to be applied and their impacts. The product could also be used to track other medical disciplines (laboratory) and for other essential hospital tools (telephone directory, patient records, etc.).

Quality standards and accreditations

The use of this type of tool meshes perfectly with the goals of the accreditations, whether regional (ARS), national (bQuaadril), or international (JCI), and can be a real aid to obtaining these accreditations and a facilitator for hospital quality managers.

# What has this meant in practice?

Question: on-call activity is always complicated to monitor...but what is the global trend? Do I need to mobilise more personnel?
The global view lets you focus on a day of the week and a time slot, and to view the average number of
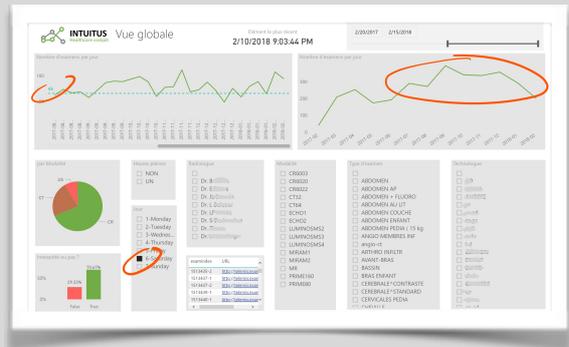

Question: where do my patients come from, and what exams are they coming for? How can I find out my catchment area? And this type of exam too...
The interactive map lets you select the patient's age (paediatric, geriatric?), gender, region/country, and view the distribution on the map.
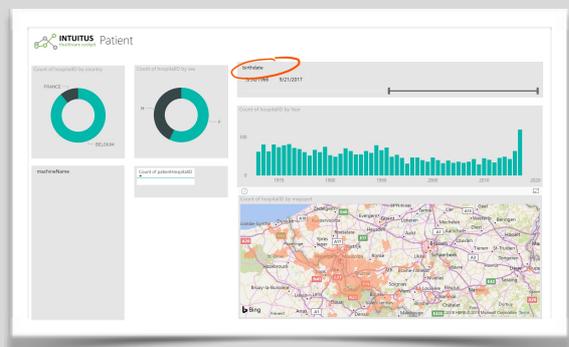

Question: are the three available rooms being fully utilised? Or do we need to optimise our use of other rooms and make savings?
The roomwise activity view lets you compare the use of the rooms selected in the interface hour by hour.
